1.0 Introduction

This document provides basic information for using Version 1 of the Advanced Technology Microwave Sounder (ATMS) Level 1B products produced by the Suomi-National Polar-Orbiting Partnership (S-NPP) Sounder Science Investigator-led Processing System (SIPS) at the NASA Goddard Space Flight Center (GSFC).

The ATMS Level 1B product is geolocated and calibrated to antenna temperature.

The ATMS Level 1A product is not described in detail in this document.

1.1 Sounder SIPS

The Suomi-National Polar-Orbiting Partnership (S-NPP) Sounder SIPS, is one of six SIPSs formed by NASA to provide the processing of level 0 data through level 1, level 2 and level 3 from the Soumi NPP (previously known as NPP) satellite. The Suomi-NPP satellite is managed by the National Polar-orbiting Partnership (NPP) which includes elements from NASA, NOAA and DoD. Specific details about the S-NPP Mission can be found at: http://npp.gsfc.nasa.gov/index.html.

The S-NPP Sounder SIPS is a team made up of the Jet Propulsion Laboratory (JPL) and the Goddard Earth Sciences Data and Information Services Center (GES DISC). JPL provides the overall project management, science algorithm software integration, test and validation support. The GES DISC performs level 0 data acquisition, routine data processing operations. The GES DISC / Distributed Active Archive Center and distribution of the data products and associated documentation.

Table 1.1 S-NPP SIPSs.

Science Team	SIPS	Instrument(s) Analyzed
Sounder	Sounder	ATMS and CrIS
Ozone	Ozone	OMPS
Ceres	CERES CARS	CERES
Land	Land	VIIRS
Atmospheres	Atmospheres	VIIRS
Ocean	Ocean	VIIRS

The SIPSs may also develop additional products that may help their science teams analyze how well S-NPP products will be useful for continuing ongoing climate studies. Consequently, most SIPSs produce a variety of data products for their science teams. Since it is possible that many of these data products may have general utility to the science community beyond the S-NPP science teams, NASA requests that SIPS products be made available to the public. This is consistent with NASA's Earth Science Data Policy https://science.nasa.gov/earth-science/earth-science-data/data-information-policy

1.2 Mission Instrument Description

The S-NPP satellite was launched on October 28, 2011 from Vandenburg Air Force Base in California. The ATMS is one of 5 instruments onboard the S-NPP satellite. The other instruments are: Clouds and the Earth's Radiant Energy System (CERES), Cross-track Infrared Sounder (CrIS), Ozone Mapping and Profiler Suite (OMPS) and Visible Infrared Imaging Radiometer Suite (VIIRS). Table 1.2.1and Table 1.2.2 contain a summary of the ATMS instrument and platform parameters.

NOTE: The ATMS instrument's Scan Drive Mechanism on S-NPP has been experiencing additional wear on the bearings. To extend the life of the instrument, a decision was made to perform scan reversals for the purpose of 're-wetting' the bearings. The scan reversals are now occurring twice per orbit, starting Aug 9, 2016. The end result of this maneuver is a slight loss of data. You will notice this loss by Fill Values.

Table 1.2.1 Instrument parameters.

Platform	Instrument	Instrument Type	Scan Rate (s)	Scan Range (°)	Scan Pattern	FOR Dia (km, nadir)	Spectral Channels
S-NPP	ATMS	MW	8/3	±53	96	16-75	22

Table 1.2.2 Approximate orbital parameters.

Platform	Alt	Orbit Incl. (°)	Equator X Time	Period	Repeat Orbits	Repeat Days	Launch
S-NPP	824	98.7	13:30*	101	228	16	28 Oct 2011

1.3 Data Disclaimer

Version 1.0 ATMS Level 1B data are released to the public as is. Every effort has been made to properly represent the data for which this document describes.

1.4 Contact Information

For information, questions or concerns with this ATMS L1B data set, please contact:
Ruth Monarrez at Ruth.Monarrez@jpl.nasa.gov or send your question to:
sounder.sips@jpl.nasa.gov.

2.0 ATMS Level 1B Product Overview

The ATMS Level 1B product consists of calibrated radiances and geolocation along with any metadata necessary to use and interpret this product.

2.1 Product Granulation and Identification

The ATMS product is divided into a series of 6-minute segments or granules with each granule making up one file and 240 granules per day. Each file contains all observations for a given type made during a period of exactly 6 minutes. For each day, each 240 files are identified by granule number in the filename. For example, **g156** for granule 156 out of 240.

The nominal start time of granule 1 is defined to be 00:00:00. Because both CrIS and ATMS instruments are synced to TAI, the start time of the first 8-second scanset of a day can be anywhere up to 8 seconds later. It moves 1 second with each leap second. If the first scanset starts 8 seconds after the nominal start time, then the data can extend up to 8 seconds past the nominal end time.

The ability to uniquely identify a granule is built in to the ATMS L1B product. This is extremely useful when publishing analysis results. The nominal time coverage, represented as a string: yyyymmddThhmm, is used to construct a unique granule identifier called "gran_id". gran_id is stored as a global attribute that is also used in the filename, see section 2.6 File Naming Convention.

In addition, there is an observation identifier variable called "obs_id" that can further uniquely identify an observation within the granule. The obs_id is formatted as the gran_id with observation information appended to it.

The format of obs_id is: yyyymmddThhmm.aaaExx where 'aaa' is the 3-digit along-track index (001 – 135) and xx is the cross-track index (01 – 96). The "E" indicates earth view.

Example of obs_id: `20170401T2354.001E01`

2.2 Algorithm Background

The Sounder SIPS ATMS L1B data products are a product of processing NASA Level 0 data through Level 1A/Geolocation and Level 1B. See Figure 1.

The ATMS Level 1A processing extracts radiance counts from ATMS science telemetry, converts engineering counts from the health and status telemetries into physical measurements such as temperatures.

The L1A geolocation processing derives spacecraft positions and attitude according to spacecraft diary telemetry. It also projects ATMS sounding field-of-views (FOV) onto the topographic surface with geolocation, line-of-site (LOS) view angles, solar angles, and surface parameters such as elevations and land fractions.

The L1B processing then applies calibration coefficients (gain and offset) and non-linearity correction to the radiances counts to convert them to antenna temperatures. L1B also propagates all the geolocation parameters from L1A processing to the L1B product.

Full details of the L1B processing steps and calibrations can be found in the NASA L1b: Advanced Technology Microwave Sounder Algorithm Theoretical Basis Document (ATBD) (Reference 1).

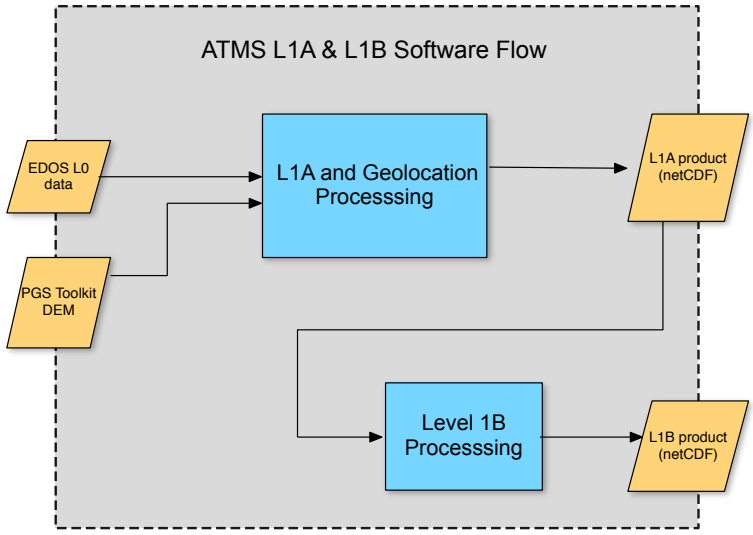

Figure 1

2.3 Data Organization

The **ATMS** products are divided into a series of 6 minute segments with one segment per file. Each file contains all observations of a given type made during a period of exactly 6 minutes. For each day there are 240 files (also known as granules), identified by granule number in the filename.

2.4 File Format and Structure

The ATMS L1B files, similar to the CrIS L1B files, are in Network Common Data Form, version 4 (NetCDF4)/HDF5 format.

The product format takes advantage of the NetCDF4 data model and makes use of groups, dimensions, variables and attributes to fully describe the science data. Below is a basic structure of a l1b datafile.

```
netcdf l1b_atms {
      dimension:
      // global attributes:
      variables:
      group: aux {
            variables:
      } // aux
} // l1b_atms
```

2.5 Metadata

Every effort has been made to ensure that metadata conforms to the Climate and Forecasting (CF), Version 1.6, and Attribute Conventions for Data Discovery (ACDD), Version 1.3, guidelines.

See the full product specification in Appendix B.

For more information on CF, refer to:
http://cfconventions.org/

For more information on ACDD, refer to:
http://wiki.esipfed.org/index.php?title=Category:Attribute_Conventions_Dataset_Discovery

2.6 File Naming Convention

File naming for Sounder SIPS products will be unique and include the following tokens separated by the delimiter '.' For each token that makes up the filename, there will be an attribute in the data product that it maps to (see Table 2.5 Filenaming).

Sounder_SIPS_ID.Platform.Inst_ID.granuleID.product_granularity.granule_number.product_type.variant.version.production_location.prod_timestamp.nc

SNDR.SNPP.ATMS.*yyyymmdd*T*hhmm*.m06.g196.L1A.std.v*mm_mm*.G.*yymmddhhmmss*.nc

SNDR.SNPP.ATMS.*yyyymmdd*T*hhmm*.m06.g196.L1A.std.v*mm_mm_mm*.J.*yymmddhhmmss*.nc
: when produced at JPL

Filename examples:

6-minute ATMS Level 1A & 1B granules:
SNDR.SNPP.ATMS.20150407T1106.m06.g196.L1A.std.v01_00.G.150407123456.nc

SNDR.SNPP.ATMS.20150407T1106.m06.g196.L1B.std.v01_00.G.150407123459.nc

Where:

- **Sounder_SIPS_ID** as a project identifier <product_name_project> = SNDR
- **Platform** <product_name_platform> = SNPP
- **Inst_ID** <product_name_instr> = ATMS
- **granuleID** (yyyymmddThhmm) <gran_id> nominal start time where:
  - yyyy = year
  - mm = month of year (01-12)
  - dd = day of month (01-31)
  - hh = hour (00-24)
  - mm = minute (00-59)
- **product_granularity** <product_name_duration> = m06 (6 minute)
- **granule_number** <granule_number> = g###
- **product_type** with an optional identifier for testing <product_type_name_id>
  - L1B for ATMS Level 1B

- **variant** <product_name_variant> = std
- **version** vmm_mm <product_name_version> - eg. v01_08
  - Versioning will be synchronized across Sounder SIPS products
- **production_location** <product_name_producer>- J=SIPS at JPL, G=Operations, T=Test, W = CrIS Team at U Wisc
- **prod_timestamp** so each product has a unique name (yymmddhhmmss) <product_name_timestamp>- 150407123456
- **Extension** (.nc)

Table 2.6 Fileanaming

Filename token	Attribute name in CDF (mapping)	Format	Value(s)	Notes
Sounder_SIPS_ID	product_name_project		SNDR	
Platform	product_name_platform		SNPP	
Inst_ID	product_name_instr		ATMS, CrIS	
granuleID	gran_id	yyyymmddThhmm	Nominal start time	
product_granularity	product_name_duration		m06	6 minutes
granule_number	granule_number	g###	g001 – g240	Only for 6-minute granule products
product_type	product_name_type_id + optional identifier for uniqueness		L1A, L1B, L1BNSR	NSR = Normal Spectral Resolution
Version	product_name_version	v01_##; v01_##_##		e.g. v01_08; v01_08_00 (when produced at JPL)

variant	product_name_variant	Freeform text. No whitespace or punctuation except underscore.	std	Used to identify special runs. The default is: std = standard.
production_location	product_name_producer		J: Jet Propulsion Laboratory G: Goddard Space Flight Center T: Test W: University of Wisconsin	
prod_timestamp	product_name_timestamp	yymmddhhmmss		

3.0 Data Contents

The ATMS L1B data products are written in NetCDF4 format and therefore makes use of groups, dimensions, variables and attributes (global & variable). Every NetCDF4/HDF5 file contains, at a minimum, one root group which is unnamed.

Attention should be given to quality flags and checked for fill values before being used for any analysis or higher processing of the L1B product.

A full profile of the contents of the files is included in Appendix B.

Selected fields are highlighted in this section.

3.1 Dimensions

Key dimensions used throughout the ATMS L1B product.

Table 3.1 Dimensions

Dimension name	Size	Meaning
atrack	135	Along-track spatial dimension
xtrack	96	Cross-track spatial dimension
channel	22	ATMS channels
band	5	Microwave bands: K, Ka, V, W, G
utc_tuple	7	year, month, day, hour, minute, second, msec

3.2 Global Attributes

There are two types of attributes: global & variable. In this secion we will talk about global attributes. Global attributes, sometimes referred to as 'file-level attributes', provide information about the entire file or 6-minute granule. This includes observation times, publisher and creator information, data provenance, geolocation information. Many attributes are required to conform to the CF & ACDD standards while other attributes are written for consistency with legacy products, hence, you may find some information to be a little redundant or differing in the naming convention.

There are some QA global attributes that should be considered before using the data in analysis or processing. See Table 3.2.2 Global Attributes or Appendix B: CDL File Definition for full definition.

Table 3.2.1 QA

Attribute Name	Type	Dimension	Description
AutomaticQualityFlag	string		**Passed**: the granule contains a non-degraded calibrated brightness temperature or radiance for at least one channel in a geolocated FOV **Suspect**: the granule does not qualify as "Passed" but contains a (possibly degraded) calibrated brightness temperature or radiance for at least one channel (possibly without associated geolocation) **Failed**: the granule contains no calibrated brightness temperatures/radiances.
geo_qual	ushort	atrack, xtrack	Overall value of 0 indicates no critical issues. Bit 2 (surface_loc)- Failed geolocation on Earth topographic surface Bit 3 (DEM) - Could not set FOV surface elevations and land water fraction Bit 4 (geoid_loc) - Failed geolocation on Earth geoid Bit 5 (solar_ang) - Failed to set solar zenith or azimuth angles Bit 6 (spacecraft_ang) - Failed to set spacecraft zenith or azimuth angles Bit 7 - Unused (0) Bit 8 (band_specific) - Failed geolocation of some bands
qa_no_data	string		A simple indicator of whether this is an "empty" granule with no data from the instrument. "TRUE" or "FALSE".

A full definition of the global attributes can be found in Appendix B: CDL File Definition.

Table 3.2.2 Global Attributes

Attribute Name	Type	Description	Heritage
naming_authority	string	The organization that provides the initial id (see above) for the dataset. The naming authority should be uniquely specified by this attribute. We recommend using reverse-DNS naming for the naming authority; URIs are also acceptable. Example: 'edu.ucar.unidata'.	ACDD Recommended
history	string	Provides an audit trail for modifications to the original data. This attribute is also in the NetCDF Users Guide: 'This is a character array with a line for each invocation of a program that has modified the dataset. Well-behaved generic netCDF applications should append a line containing: date, time of day, user name, program name and command arguments.' To include a more complete description you can append a reference to an ISO Lineage entity; see NOAA EDM ISO Lineage guidance.	CF, ACDD Recommended
source	string	The method of production of the original data. If it was model-generated, source should name the model and its version. If it is observational, source should characterize it. This attribute is defined in the CF Conventions. Examples: 'temperature from CTD #1234'; 'world model v.0.1'.	CF, ACDD Recommended
processing_level	string	A textual description of the processing (or quality control) level of the data.	ACDD Recommended
product_name_type_id	string	Product name as it appears in product_name (L1A, L1B, L2, SNO_AIRS_CrIS)	
comment	string	Miscellaneous information about the data or methods used to produce it. Can be empty.	CF, ACDD Recommended
acknowledgment	string	A place to acknowledge various types of support for the project that produced this data.	ACDD Recommended
license	string	Provide the URL to a standard or specific license, enter "Freely Distributed" or "None", or describe any restrictions to data access and distribution in free text.	ACDD Recommended
standard_name_vocabulary	string	The name and version of the controlled vocabulary from which variable standard names are taken. (Values for any standard_name attribute must come from the CF Standard Names vocabulary for the data file or product to comply with CF.) Example: 'CF Standard Name Table v27'.	ACDD Recommended
date_created	string	The date on which this version of the data was created. (Modification of values implies a new version, hence this would be assigned the date of the most recent values modification.) Metadata changes are not considered when assigning the date_created. The ISO 8601:2004 extended date format is recommended, as described in the Attribute Content Guidance section.	ACDD Recommended, ECS/AIRS ProductionDateTime
creator_name	string	The name of the person (or other creator type specified by the creator_type attribute) principally responsible for creating this data.	ACDD Recommended
creator_email	string	The email address of the person (or other creator type specified by the creator_type attribute) principally responsible for creating this data.	ACDD Recommended

creator_url	string	The URL of the person (or other creator type specified by the creator_type attribute) principally responsible for creating this data.	ACDD Recommended
institution	string	Processing facility that produced this file	CF, ACDD Recommended
project	string	The name of the project(s) principally responsible for originating this data. Multiple projects can be separated by commas, as described under Attribute Content Guidelines. Examples: 'PATMOS-X', 'Extended Continental Shelf Project'.	ACDD Recommended
publisher_name	string	The name of the person (or other entity specified by the publisher_type attribute) responsible for publishing the data file or product to users, with its current metadata and format.	ACDD Recommended
publisher_email	string	The email address of the person (or other entity specified by the publisher_type attribute) responsible for publishing the data file or product to users, with its current metadata and format.	ACDD Recommended
publisher_url	string	The URL of the person (or other entity specified by the publisher_type attribute) responsible for publishing the data file or product to users, with its current metadata and format.	ACDD Recommended
geospatial_bounds	string	Describes the data's 2D or 3D geospatial extent in OGC's Well-Known Text (WKT) Geometry format (reference the OGC Simple Feature Access (SFA) specification). The meaning and order of values for each point's coordinates depends on the coordinate reference system (CRS). The ACDD default is 2D geometry in the EPSG:4326 coordinate reference system. The default may be overridden with geospatial_bounds_crs and geospatial_bounds_vertical_crs (see those attributes). EPSG:4326 coordinate values are latitude (decimal degrees_north) and longitude (decimal degrees_east), in that order. Longitude values in the default case are limited to the -180, 180) range. Example: 'POLYGON ((40.26 -111.29, 41.26 -111.29, 41.26 -110.29, 40.26 -110.29, 40.26 -111.29))'.	ACDD Recommended
geospatial_bounds_crs	string	The coordinate reference system (CRS) of the point coordinates in the geospatial_bounds attribute. This CRS may be 2-dimensional or 3-dimensional, but together with geospatial_bounds_vertical_crs, if that attribute is supplied, must match the dimensionality, order, and meaning of point coordinate values in the geospatial_bounds attribute. If geospatial_bounds_vertical_crs is also present then this attribute must only specify a 2D CRS. EPSG CRSs are strongly recommended. If this attribute is not specified, the CRS is assumed to be EPSG:4326. Examples: 'EPSG:4979' (the 3D WGS84 CRS), 'EPSG:4047'.	ACDD Recommended
geospatial_lat_min	float	Describes a simple lower latitude limit; may be part of a 2- or 3-dimensional bounding region. Geospatial_lat_min specifies the southernmost latitude covered by the dataset.	ACDD Recommended

geospatial_lat_max	float	Describes a simple upper latitude limit; may be part of a 2- or 3-dimensional bounding region. Geospatial_lat_max specifies the northernmost latitude covered by the dataset.	ACDD Recommended
geospatial_lon_min	float	Describes a simple longitude limit; may be part of a 2- or 3-dimensional bounding region. geospatial_lon_min specifies the westernmost longitude covered by the dataset. See also geospatial_lon_max.	ACDD Recommended
geospatial_lon_max	float	Describes a simple longitude limit; may be part of a 2- or 3-dimensional bounding region. geospatial_lon_max specifies the easternmost longitude covered by the dataset. Cases where geospatial_lon_min is greater than geospatial_lon_max indicate the bounding box extends from geospatial_lon_max, through the longitude range discontinuity meridian (either the antimeridian for -180:180 values, or Prime Meridian for 0:360 values), to geospatial_lon_min; for example, geospatial_lon_min=170 and geospatial_lon_max=-175 incorporates 15 degrees of longitude (ranges 170 to 180 and -180 to -175).	ACDD Recommended
time_coverage_start	string	Nominal start time. Describes the time of the first data point in the data set. Use the ISO 8601:2004 date format, preferably the extended format as recommended in the Attribute Content Guidance section.	ACDD Recommended
time_of_first_valid_obs	string	Describes the time of the first valid data point in the data set. Use the ISO 8601:2004 date extended format.	
time_coverage_mid	string	Describes the midpoint between the nominal start and end times. Use the ISO 8601:2004 date format, preferably the extended format as recommended in the Attribute Content Guidance section.	Sounder SIPS extension by analogy with ACDD time_coverage_start and time_coverage_end
time_coverage_end	string	Nominal end time. Describes the time of the last data point in the data set. Use ISO 8601:2004 date format, preferably the extended format as recommended in the Attribute Content Guidance section.	ACDD Recommended
time_of_last_valid_obs	string		
time_coverage_duration	string	Describes the duration of the data set. Use ISO 8601:2004 duration format, preferably the extended format as recommended in the Attribute Content Guidance section.	ACDD Recommended
product_name_duration	string	Product duration as it appears in product_name (m06 means six minutes)	
creator_type	string	Specifies type of creator with one of the following: 'person', 'group', 'institution', or 'position'. If this attribute is not specified, the creator is assumed to be a person.	ACDD Suggested

creator_institution	string	The institution of the creator; should uniquely identify the creator's institution. This attribute's value should be specified even if it matches the value of publisher_institution, or if creator_type is institution.	ACDD Suggested
product_version	string	Version identifier of the data file or product as assigned by the data creator. For example, a new algorithm or methodology could result in a new product_version.	ACDD Suggested, (ECS versionid)
keywords_vocabulary	string	If you are using a controlled vocabulary for the words/phrases in your "keywords" attribute, this is the unique name or identifier of the vocabulary from which keywords are taken. If more than one keyword vocabulary is used, each may be presented with a prefix and a following comma, so that keywords may optionally be prefixed with the controlled vocabulary key. Example: 'GCMD:GCMD Keywords, CF:NetCDF COARDS Climate and Forecast Standard Names'.	ACDD Suggested
platform	string	Name of the platform(s) that supported the sensor data used to create this data set or product. Platforms can be of any type, including satellite, ship, station, aircraft or other. Indicate controlled vocabulary used in platform_vocabulary.	ACDD Suggested
platform_vocabulary	string	Controlled vocabulary for the names used in the "platform" attribute.	ACDD Suggested
product_name_platform	string	Platform name as it appears in product_name	
instrument	string	Name of the contributing instrument(s) or sensor(s) used to create this data set or product. Indicate controlled vocabulary used in instrument_vocabulary.	ACDD Suggested
instrument_vocabulary	string	Controlled vocabulary for the names used in the "instrument" attribute.	ACDD Suggested
product_name_instr	string	Instrument name as it appears in product_name	
product_name	string	Canonical fully qualified product name (official file name)	ECS LocalGranuleID
product_name_variant	string	Processing variant identifier as it appears in product_name. 'std' (shorthand for 'standard') is to be the default and should be what is seen in all public products.	
product_name_version	string	Version number as it appears in product_name (v01_00_00)	
product_name_producer	string	Production facility as it appears in product_name (single character) 'T' is the default, for unofficial local test products	
product_name_timestamp	string	Processing timestamp as it appears in product_name (yymmddhhmmss)	
product_name_extension	string	File extension as it appears in product_name (typically nc)	
granule_number	ushort	granule number of day (1-240)	AIRS

product_name_granule_number	string	zero-padded string for granule number of day (g001-g240)	AIRS
gran_id	string	Unique granule identifier yyyymmddThhmm of granule start, including year, month, day, hour, and minute of granule start time	
geospatial_lat_mid	float	granule center latitude	AIRS LatgranuleCen
geospatial_lon_mid	float	granule center longitude	AIRS LongranuleCen
featureType	string	structure of data in file	CF
data_structure	string	a character string indicating the internal organization of the data with currently allowed values of 'grid', 'station', 'trajectory', or 'swath'. The 'structure' here generally describes the horizontal structure and in all cases data may also be functions, for example, of a vertical coordinate and/or time. (If using CMOR pass this in a call to cmor_set_cur_dataset_attribute.)	CMIP5/CMOR
cdm_data_type	string	The data type, as derived from Unidata's Common Data Model Scientific Data types and understood by THREDDS. (This is a THREDDS "dataType", and is different from the CF NetCDF attribute 'featureType', which indicates a Discrete Sampling Geometry file in CF.)	ACDD Suggested
identifier_product_doi_authority	string	digital signature source	AIRS
algorithm_version	string	The version of the algorithm in whatever format is selected by the developers. Versions from multiple sub-algorithms may be concatenated with semicolon separators. (ex: 'CCAST 4.2; BB emis from MIT 2016-04-01')	
production_host	string	Identifying information about the host computer for this run. (Output of linux "uname -a" command.)	
format_version	string	Format version.	
input_file_names	string	Semicolon-separated list of names or unique identifiers of files that were used to make this product. There will always be one space after each semicolon. There is no final semicolon.	ECS InputPointer; ISO Source Citation
input_file_types	string	Semicolon-separated list of tags giving the role of each input file in input_file_names. There will always be one space after each semicolon. There is no final semicolon.	ISO Source Description
input_file_dates	string	Semicolon-separated list of creation dates for each input file in input_file_names. There will always be one space after each semicolon. There is no final semicolon.	ISO Source Creation Date

orbitDirection	string	Orbit is ascending and/or descending. Values are "Ascending" or "Descending" if the entire granule fits that description. "NorthPole" and "SouthPole" are used for polar-crossing granules. "NA" is used when a determination cannot be made.	SMAP uses this attribute name but only asc/desc because files are half orbits. The values used here are similar to AIRS node_type.
day_night_flag	string	Data is day or night. "Day" means subsatellite point for all valid scans has solar zenith angle less than 90 degrees. "Night" means subsatellite point for all valid scans has solar zenith angle greater than 90 degrees. "Both" means the dataset contains valid observations with solar zenith angle above and below 90 degrees. "NA" means a value could not be determined.	AIRS DayNightFlag
AutomaticQualityFlag	string	*"Passed":* the granule contains a non-degraded calibrated brightness temperature or radiance for at least one channel in a geolocated FOV *"Suspect":* the granule does not qualify as "Passed" but contains a (possibly degraded) calibrated brightness temperature or radiance for at least one channel (possibly without associated geolocation) *"Failed":* the granule contains no calibrated brightness temperatures/radiances.	ECS. AIRS called it AutomaticQA Flag in HDF attributes but AutomaticQua lityFlag in metadata.
qa_pct_data_missing	float	Percentage of expected observations that are missing.	ECS, maps to (part of) ISO 19115 Completeness Comission
qa_pct_data_geo	float	Percentage of expected observations that are successfully geolocated.	maps to (part of) ISO 19115 Completeness Comission
qa_pct_data_sci_mode	float	Percentage of expected observations that were taken while the instrument was in science mode and are successfully geolocated.	maps to (part of) ISO 19115 Completeness Comission
qa_no_data	string	A simple indicator of whether this is an "empty" granule with no data from the instrument. "TRUE" or "FALSE".	

3.3 Variable Attributes

Each variable has its own associated attributes. Variables attributes are a CF standard and are used to describe the variable in full detail to properly interpret its value.

Table 3.3: Variable Attributes

Attribute	Relevant standard(s)	Description
units	CF, UDUNITS	units, for variables that represent physical quantities
_FillValue	CF, NetCDF	a single sentinel value indicating the data point contains fill instead of valid data
standard_name	CF	standard name from the CF standard name table, if one exists for the quantity being represented
long_name	CF	a longer name describing the quantity being represented, suitable for a plot title
valid_range	CF	a pair of values indicating the minimum and maximum values to be considered valid
coordinates	CF	a space-separated list of the names of other variables that are coordinates for this variable
description		a longer description of the quantity being represented
coverage_content_type	ACDD, ISO 19115-1	indicates the source of the data
ancillary_variables	CF	a space-separated list of the names of other variables that contain information about this variable
bounds	CF	defines the extent, for cell variables
cell_methods	CF	describes statistical methods used to derive data, for cell variables
flag_values	CF	a comma-separated list of flag values, for variables that represent flags
flag_meanings	CF	a space separated list of the meanings of each flag value, for variables that represent flags
flag_masks	CF	a comma-separated list of flag masks, for variables that represent flags. If this attribute is present, the basic rule is “apply the flag mask and if you get the flag value, it means the flag meaning”

3.4 Geolocation

Key geophysical dimensions are spacecraft position and altitude.

Table 3.4.1 Geolocation Dimensions

Dimension name	Size	Meaning
atrack	135	Along-track spatial dimension
xtrack	96	Cross-track spatial dimension

And the key geolocation variables are:

Table 3.4.2 Geolocation Variables

Geolocation Variable	Dimensions	Type	Meaning
lat	atrack, xtrack	32-bit floating-point	latitude of fov center
lon	atrack, xtrack	32-bit floating-point	longitude of fov center
obs_time_tai	atrack, xtrack	64-bit floating-point	earth view observation midtime for each fov in units of seconds since 1993-01-01T00:00:00
obs_time_utc	atrack, xtrack, utc_tuple	16-bit integer	UTC earth view observation time as an array of integers: year, month, day, hour, minute, second, msec

3.5 Key Science Data Fields

Key science data fields and the aux group and their dimensions are defined below.

Table 3.5.1 Science Data Fields

Variable	Dimensions	Type	Meaning
antenna_temp	atrack, xtrack, channel	32-bit floating-point	Calibrated scene brightness temperature for each ATMS channel and beam position. This output is the Rayleigh equivalent temperature and not the Planck blackbody equivalent temperature
cold_nedt	channel	32-bit floating-	Noise equivalent delta temperature

		point	derived from observations of cold space
warm_nedt	channel	32-bit floating-point	Noise equivalent delta temperature derived from observations of the warm calibration target

The aux group is not readily used by the wider user community but is provided here for completeness.

Table 3.5.2 Aux Group

Variable Name	Type	Dimension	Units	Description
offset	float	atrack, channel	Kelvin	Offset used in calibrating earth scene brightness temps
gain	float	atrack, channel	Count/Kelvin	Gain factor used in calibrating earth scene brightness temps.
nonlin	float	atrack, xtrack, channel	Kelvin	Nonlinearity correction used in calibrating earth scene brightness temps
cold_temp	float	atrack, channel	Kelvin	Effective temperature of cold calibration view (space) (Tcc)";
warm_temp	float	atrack, channel	Kelvin	Effective temperature of warm calibration view (black body) (Twc)";

3.6 Missing Data / Fill Values

On occasion, there will be data that is missing for whatever reason. In the situation where there are incomplete granules within the 6-minute product granule, the missing data will be filled with a 'Fill Values'. The fill value is indicated by the attribute '_FillValue'. The fill value will exist in the same location the missing data would exist. This will preserve the shape of the 6-minute granule. Should the data for an entire 6-minute granule be missing, a granule will still be produced and will contain all fill values. In other words, a full fill-value granule will be produced. With this in mind, it is advised to check the data for fill values before it is used. The fill values are listed in the table below.

Table: 3.6.1 Fill Values

Variable Type	Fill Value
ubyte	255UB
ushort	65535US
uint	4294967295U
float	9.96921e+36f
double	9.96920996838687e+36

4.0 Options for Reading the Data

The ATMS L1B files are written in NetCDF4/HDF5. Because NetCDF4 builds upon the classic NetCDF data model using HDF5 as the storage layer, a user of the data product can take full advantage of tools and libraries readily available to access the data.

Every NetCDF4 file is considered an HDF5 file, however, not every HDF5 file is necessarily a NetCDF4 file. A limited subset of the HDF5 data model and file format features are used in NetCDF4 files. Conformance to the earlier mentioned CF & ACDD standards allows for users to take advantage of most NetCDF interfaces.

Tools and libraries for reading NetCDF4 as well as a NetCDF Users' Guide are written and maintained by Unidata and can be found online at:

http://www.unidata.ucar.edu/software/netcdf/

There are a number of interfaces available for reading NetCDF for different programming languages including: C/C++, Fortran, Matlab, IDL, Python and Perl.

Additionally, but can also be accessed with HDF5 tools and libraries available at:

https://www.hdfgroup.org/products/hdf5_tools/

5.0 Data Services

The ATMS Level 1B products are available to the user community via the Goddard Distributed Active Archive Center (GDAAC).

https://disc.gsfc.nasa.gov/datasets/SNPPATMSL1B_V1/summary

The ATMS Level 1A products are not made publicly available. No other Data Services are provided for these products.

Appendix A: calib_degraded Flag

Flag	Bin index	Num bits	meaning
reserved	28-32	1	0
sv4_moon_unknown	27	1	Missing moon angle for this scan's space view #4. Lunar intrusion status is unknown.
sv3_moon_unknown	26	1	Missing moon angle for this scan's space view #3. Lunar intrusion status is unknown.
sv2_moon_unknown	25	1	Missing moon angle for this scan's space view #2. Lunar intrusion status is unknown.
sv1_moon_unknown	24	1	Missing moon angle for this scan's space view #1. Lunar intrusion status is unknown.
sv4_bad	23	1	This scan's space view #4 not used because of lunar intrusion or other problem. A scan-specific calibration may still be calculated using space views from neighboring views and scans.
sv3_bad	22	1	This scan's space view #3 not used because of lunar intrusion or other problem. A scan-specific calibration may still be calculated using space views from neighboring views and scans.
sv2_bad	21	1	This scan's space view #2 not used because of lunar intrusion or other problem. A scan-specific calibration may still be calculated using space views from neighboring views and scans.
sv1_bad	20	1	This scan's space view #1 not used because of lunar intrusion or other problem. A scan-specific calibration may still be calculated using space views from neighboring views and scans.
reserved	18 – 19	1	0
bb_bad	17	1	This scan's black body view not used. A scan-specific calibration may still be calculated using black body views from neighboring scans.
reserved	14 - 16	1	0
shelf_temp_bad	13	1	Insufficient valid shelf temperature values to use in a scan calibration. Fall-back constant shelf temperatures are used.
space_temp_bad	12	1	Insufficient effective space temperature values to produce a scan-specific calibration. Scan may still be calibrated using coefficients from another scan.
bb_temp_bad	11	1	Insufficient valid black body temperature readings to produce a scan-specific calibration. Scan may still be calibrated using coefficients from another scan.
cold_cal_bad	10	1	Insufficient valid space (cold calibration) observation counts to produce a scan-specific calibration. Scan may still be calibrated using

			coefficients from another scan.
warm_cal_bad	9	1	Insufficient valid black body (warm calibration) observation counts to produce a scan-specific calibration. Scan may still be calibrated using coefficients from another scan.
reserved	4-8	1	0
cal_from_diff_scan	3	1	Calibration values used from different scan
cal_failed	2	1	No usable calibration. Scan is not calibrated.
reserved	1	1	0

Appendix B: CDL File Definition

A full data product specification is generated by using the NetCDF4 library and using the ncdump utility. This produces a CDL text file showing the full structure of the ATMS L1b datafile.

The command used to generate the CDL file is: ncdump –h <filename>.nc

```
netcdf l1b_atms  {
dimensions:
     spatial = 3;         // directions: x, y, z
     fov_poly = 8;        // lat/lon points defining the ploygon bounding an fov
(anticlockwise as viewed from above)
     utc_tuple = 8;       // parts of UTC time
     attitude = 3;        // roll, pitch, yaw
     atrack = 135;        // along-track spatial dimension
     xtrack = 96;         // cross-track spatial dimension
     channel = 22;        // channel number
     band = 5;            // Microwave bands
     spacextrack = 4;     // space view

// global attributes:
         string :keywords="EARTH SCIENCE > SPECTRAL/ENGINEERING > MICROWAVE > ANTENNA
TEMPERATURE";  // A comma-separated list of key words and/or phrases. Keywords may be
common words or phrases, terms from a controlled vocabulary (GCMD is often used), or
URIs for terms from a controlled vocabulary (see also "keywords_vocabulary"
attribute).
         string :Conventions="CF-1.6, ACDD-1.3";
         string :naming_authority="Unassigned";  // In final published products this
is expected to be http://dx.doi.org/; The organization that provides the initial id
(see above) for the dataset. The naming authority should be uniquely specified by this
attribute. We recommend using reverse-DNS naming for the naming authority; URIs are
also acceptable. Example: 'edu.ucar.unidata'.
         string :history="";  // Requirement against executable that writes the
NetCDF. Value will be appended to and not overwritten.; Provides an audit trail for
modifications to the original data. This attribute is also in the NetCDF Users Guide:
'This is a character array with a line for each invocation of a program that has
modified the dataset. Well-behaved generic netCDF applications should append a line
containing: date, time of day, user name, program name and command arguments.' To
include a more complete description you can append a reference to an ISO Lineage
entity; see NOAA EDM ISO Lineage guidance.
         string :source="ATMS instrument telemetry";  // The method of production of
the original data. If it was model-generated, source should name the model and its
version. If it is observational, source should characterize it. This attribute is
```

defined in the CF Conventions. Examples: 'temperature from CTD #1234'; 'world model v.0.1'.
		string :**processing_level**="1B"; // A textual description of the processing (or quality control) level of the data.
		string :**product_name_type_id**="L1B"; // Product name as it appears in product_name (L1A, L1B, L2, SNO_AIRS_CrIS)
		string :**comment**=""; // Currently not intended to be used.; Miscellaneous information about the data or methods used to produce it. Can be empty.
		string :**acknowledgment**="Support for this research was provided by NASA."; // A place to acknowledge various types of support for the project that produced this data.
		string :**license**="Limited to Sounder SIPS affiliates"; // Provide the URL to a standard or specific license, enter "Freely Distributed" or "None", or describe any restrictions to data access and distribution in free text.
		string :**standard_name_vocabulary**="CF Standard Name Table v28"; // The name and version of the controlled vocabulary from which variable standard names are taken. (Values for any standard_name attribute must come from the CF Standard Names vocabulary for the data file or product to comply with CF.) Example: 'CF Standard Name Table v27'.
		string :**date_created**="Unassigned"; // PGE responsibility; The date on which this version of the data was created. (Modification of values implies a new version, hence this would be assigned the date of the most recent values modification.) Metadata changes are not considered when assigning the date_created. The ISO 8601:2004 extended date format is recommended, as described in the Attribute Content Guidance section.
		string :**creator_name**="Unassigned"; // The name of the person (or other creator type specified by the creator_type attribute) principally responsible for creating this data.
		string :**creator_email**="Unassigned"; // The email address of the person (or other creator type specified by the creator_type attribute) principally responsible for creating this data.
		string :**creator_url**="Unassigned"; // The URL of the person (or other creator type specified by the creator_type attribute) principally responsible for creating this data.
		string :**institution**="Unassigned"; // Processing facility that produced this file
		string :**project**="Sounder SIPS"; // The name of the project(s) principally responsible for originating this data. Multiple projects can be separated by commas, as described under Attribute Content Guidelines. Examples: 'PATMOS-X', 'Extended Continental Shelf Project'.
		string :**product_name_project**="SNDR"; // The name of the project as it appears in the file name. 'SNDR' for all Sounder SIPS products, even AIRS products.
		string :**publisher_name**="Unassigned"; // The name of the person (or other entity specified by the publisher_type attribute) responsible for publishing the data file or product to users, with its current metadata and format.
		string :**publisher_email**="Unassigned"; // The email address of the person (or other entity specified by the publisher_type attribute) responsible for publishing the data file or product to users, with its current metadata and format.
		string :**publisher_url**="Unassigned"; // The URL of the person (or other entity specified by the publisher_type attribute) responsible for publishing the data file or product to users, with its current metadata and format.
		string :**geospatial_bounds**=""; // Will use the POLYGON as shown in the description. The example is clockwise as viewed from above, but WKT spec at https://en.wikipedia.org/wiki/Well-known_text says it should be counter-clockwise. We'll go counterclockwise. The last point must repeat the first point to provide closure. L1A PGE geolocation fills in and later PGEs copy.; Describes the data's 2D or 3D geospatial extent in OGC's Well-Known Text (WKT) Geometry format (reference the OGC Simple Feature Access (SFA) specification). The meaning and order of values for each point's coordinates depends on the coordinate reference system (CRS). The ACDD default is 2D geometry in the EPSG:4326 coordinate reference system. The default may be overridden with geospatial_bounds_crs and geospatial_bounds_vertical_crs (see those attributes). EPSG:4326 coordinate values are latitude (decimal degrees_north) and longitude (decimal degrees_east), in that order. Longitude values in the default case

are limited to the -180, 180) range. Example: 'POLYGON ((40.26 -111.29, 41.26 -111.29, 41.26 -110.29, 40.26 -110.29, 40.26 -111.29))'.
string :**geospatial_bounds_crs**="EPSG:4326"; // The coordinate reference system (CRS) of the point coordinates in the geospatial_bounds attribute. This CRS may be 2-dimensional or 3-dimensional, but together with geospatial_bounds_vertical_crs, if that attribute is supplied, must match the dimensionality, order, and meaning of point coordinate values in the geospatial_bounds attribute. If geospatial_bounds_vertical_crs is also present then this attribute must only specify a 2D CRS. EPSG CRSs are strongly recommended. If this attribute is not specified, the CRS is assumed to be EPSG:4326. Examples: 'EPSG:4979' (the 3D WGS84 CRS), 'EPSG:4047'.
float :**geospatial_lat_min**=9.9692099683868690e+36f; // PGE responsibility; Describes a simple lower latitude limit; may be part of a 2- or 3-dimensional bounding region. Geospatial_lat_min specifies the southernmost latitude covered by the dataset.
float :**geospatial_lat_max**=9.9692099683868690e+36f; // PGE responsibility; Describes a simple upper latitude limit; may be part of a 2- or 3-dimensional bounding region. Geospatial_lat_max specifies the northernmost latitude covered by the dataset.
float :**geospatial_lon_min**=9.9692099683868690e+36f; // PGE responsibility; Describes a simple longitude limit; may be part of a 2- or 3-dimensional bounding region. geospatial_lon_min specifies the westernmost longitude covered by the dataset. See also geospatial_lon_max.
float :**geospatial_lon_max**=9.9692099683868690e+36f; // PGE responsibility; Describes a simple longitude limit; may be part of a 2- or 3-dimensional bounding region. geospatial_lon_max specifies the easternmost longitude covered by the dataset. Cases where geospatial_lon_min is greater than geospatial_lon_max indicate the bounding box extends from geospatial_lon_max, through the longitude range discontinuity meridian (either the antimeridian for -180:180 values, or Prime Meridian for 0:360 values), to geospatial_lon_min; for example, geospatial_lon_min=170 and geospatial_lon_max=-175 incorporates 15 degrees of longitude (ranges 170 to 180 and -180 to -175).
string :**time_coverage_start**=""; // We use nominal limits, not the actual timestamp of the first data point. (seconds always = 00.00"); Nominal start time. Describes the time of the first data point in the data set. Use the ISO 8601:2004 date format, preferably the extended format as recommended in the Attribute Content Guidance section.
string :**time_of_first_valid_obs**=""; // This is a companion to time_coverage_start. But where time_coverage_start gives the nominal limit, this gives the actual timestamp of the first valid observation included in the product.; Describes the time of the first valid data point in the data set. Use the ISO 8601:2004 date extended format.
string :**time_coverage_mid**=""; // We use nominal limits, not the actual timestamps of the first and last data points. (seconds always = 00.00"); Describes the midpoint between the nominal start and end times. Use the ISO 8601:2004 date format, preferably the extended format as recommended in the Attribute Content Guidance section.
string :**time_coverage_end**=""; // We use nominal limits, not the actual timestamp of the first data point. (seconds always = 00.00") This value may be 1 second wrong in case of a leapsecond.; Nominal end time. Describes the time of the last data point in the data set. Use ISO 8601:2004 date format, preferably the extended format as recommended in the Attribute Content Guidance section.
string :**time_of_last_valid_obs**=""; // This is a companion to time_coverage_end. But where time_coverage_end gives the nominal limit, this gives the actual timestamp of the last valid observation included in the product. Note that this can be a few seconds after the nominal end time given in time_coverage_end.;
string :**time_coverage_duration**="P0000-00-00T00:06:00"; // This value may technically be 1 second wrong in cases with leapseconds but the value will not change.; Describes the duration of the data set. Use ISO 8601:2004 duration format, preferably the extended format as recommended in the Attribute Content Guidance section.
string :**product_name_duration**="m06"; // Product duration as it appears in product_name (m06 means six minutes)
string :**creator_type**="institution"; // Specifies type of creator with one of the following: 'person', 'group', 'institution', or 'position'. If this attribute is not specified, the creator is assumed to be a person.

```
        string :creator_institution="Jet Propulsion Laboratory -- California
Institute of Technology";  // The institution of the creator; should uniquely identify
the creator's institution. This attribute's value should be specified even if it
matches the value of publisher_institution, or if creator_type is  institution.
        string :product_version="v01.00.00";  // product_version is the version
assigned to the build of the overall Sounder SIPS system.  It will increment for all
PGEs each build, even if not all PGEs have any changes.  Always of the form
'vxx.yy.zz', with 2-digit major, minor, and revision subfields.  (ex 'v01.00.12.').
Major version will correspond to DISC collection number.; Version identifier of the
data file or product as assigned by the data creator. For example, a new algorithm or
methodology could result in a new product_version.
        string :keywords_vocabulary="GCMD:GCMD Keywords";  // If you are using a
controlled vocabulary for the words/phrases in your "keywords" attribute, this is the
unique name or identifier of the vocabulary from which keywords are taken. If more
than one keyword vocabulary is used, each may be presented with a prefix and a
following comma, so that keywords may optionally be prefixed with the controlled
vocabulary key. Example: 'GCMD:GCMD Keywords, CF:NetCDF COARDS Climate and Forecast
Standard Names'.
        string :platform="SUOMI-NPP > Suomi National Polar-orbiting Partnership";  //
Name of the platform(s) that supported the sensor data used to create this data set or
product. Platforms can be of any type, including satellite, ship, station, aircraft or
other. Indicate controlled vocabulary used in platform_vocabulary.
        string :platform_vocabulary="GCMD:GCMD Keywords";  // Controlled vocabulary
for the names used in the "platform" attribute.
        string :product_name_platform="SNPP";  // Platform name as it appears in
product_name
        string :instrument="ATMS > Advanced Technology Microwave Sounder";  // Name
of the contributing instrument(s) or sensor(s) used to create this data set or
product. Indicate controlled vocabulary used in instrument_vocabulary.
        string :instrument_vocabulary="GCMD:GCMD Keywords";  // Controlled vocabulary
for the names used in the "instrument" attribute.
        string :product_name_instr="ATMS";  // Instrument name as it appears in
product_name
        string :product_name="";  // PGE responsibility; Canonical fully qualified
product name (official file name)
        string :product_name_variant="std";  // PGE Responsibility ('std' should be
the default); Processing variant identifier as it appears in product_name.  'std'
(shorthand for 'standard') is to be the default and should be what is seen in all
public products.
        string :product_name_version="vxx_xx_xx";  // product_name_version is a
simplified form of product_version that goes into the file name.  It substitutes
underscores for dots and excludes the revision subfield.  (ex 'v01_00' for
distribution; 'v01_00_12' for local). Note this string will be flowed into the PGEs
through the config files in order to provide control of how the filenames appear
across the entire ensemble of data products.; Version number as it appears in
product_name (v01_00_00)
        string :product_name_producer="T";  // PGE Responsibility; Production
facility as it appears in product_name (single character)  'T' is the default, for
unofficial local test products
        string :product_name_timestamp="yymmddhhmmss";  // PGE responsibility;
Processing timestamp as it appears in product_name (yymmddhhmmss)
        string :product_name_extension="nc";  // File extension as it appears in
product_name (typically nc)
        ushort :granule_number=0.0;  // PGE responsibility.  L1A fills in and later
PGEs copy.; granule number of day (1-240)
        string :product_name_granule_number="g000";  // PGE responsibility.  L1A
fills in and later PGEs copy.; zero-padded string for granule number of day (g001-
g240)
        string :gran_id="yymmddThhmm";  // PGE responsibility.  L1A fills in and
later PGEs copy.; Unique granule identifier yyyymmddThhmm of granule start, including
year, month, day, hour, and minute of granule start time
         float :geospatial_lat_mid=9.9692099683868690e+36f;  // PGE responsibility.
L1A fills in and later PGEs copy.; granule center latitude
```

```
          float :geospatial_lon_mid=9.9692099683868690e+36f;  // PGE responsibility.
L1A fills in and later PGEs copy.; granule center longitude
         string :featureType="point";  // should be swath but that is not permitted by
the current version of CF; structure of data in file
         string :data_structure="swath";  // a character string indicating the
internal organization of the data with currently allowed values of 'grid', 'station',
'trajectory', or 'swath'. The 'structure' here generally describes the horizontal
structure and in all cases data may also be functions, for example, of a vertical
coordinate and/or time. (If using CMOR pass this in a call to
cmor_set_cur_dataset_attribute.)
         string :cdm_data_type="Swath";  // The data type, as derived from Unidata's
Common Data Model Scientific Data types and understood by THREDDS. (This is a THREDDS
"dataType", and is different from the CF NetCDF attribute 'featureType', which
indicates a Discrete Sampling Geometry file in CF.)
         string :identifier_product_doi_authority="Unassigned";  // probably redundant
with naming_authority but retained for EOSDIS compatibility.  Expected to be
http://dx.doi.org/ in final publisted products.; digital signature source
         string :algorithm_version="";  // It is set by the PGE developers in a config
file or source code they control, so that it can be set by the PGE at run time.  If
the PGE can switch different algorithms at runtime, the selected algorithm should be
reflected here.; The version of the algorithm in whatever format is selected by the
developers.  Versions from multiple sub-algorithms may be concatenated with semicolon
separators.  (ex: 'CCAST 4.2; BB emis from MIT 2016-04-01')
         string :production_host="";  // PGE responsibility (for science code this
string will be passed in); Identifying information about the host computer for this
run.  (Output of linux "uname -a" command.)
         string :format_version="v01.04.04";  // format_version relates to the
spreadsheet. For public products it is of the form 'vxx.yy.zz'. For local runs from a
local version of the spreadsheet it will add the suffix '_Untrusted':
'vxx.yy.zz_Untrusted'. Developers update it to reflect the level of changes, but
always retain the '_Untrusted' suffix.; Format version.
         string :input_file_names="";  // File names only: not path+filename;
Semicolon-separated list of names or unique identifiers of files that were used to
make this product.  There will always be one space after each semicolon.  There is no
final semicolon.
         string :input_file_types="";  // These are human-readable tokens agreed by
the team.  A downstream process will populate metadata by keying off a list of
expected values.  Values include: ATMS_L1A, ATMS_L1B_AlgParam, ATMS_L1B_Template;
Semicolon-separated list of tags giving the role of each input file in
input_file_names.  There will always be one space after each semicolon.  There is no
final semicolon.
         string :input_file_dates="";  // Dates shall be formatted according to ISO
8601: YYYY-MM-DD; Semicolon-separated list of creation dates for each input file in
input_file_names.  There will always be one space after each semicolon.  There is no
final semicolon.
         string :orbitDirection="NA";  // Orbit is ascending and/or descending.
Values are "Ascending" or "Descending" if the entire granule fits that description.
"NorthPole" and "SouthPole" are used for polar-crossing granules.  "NA" is used when a
determination cannot be made.
         string :day_night_flag="NA";  // Data is day or night.  "Day" means
subsatellite point for all valid scans has solar zenith angle less than 90 degrees.
"Night" means subsatellite point for all valid scans has solar zenith angle greater
than 90 degrees.  "Both" means the dataset contains valid observations with solar
zenith angle above and below 90 degrees.  "NA" means a value could not be determined.
         string :AutomaticQualityFlag="Missing";  // Similar to ECS field but ECS
field is per observed parameter and here we give a single value. "Missing" is a
special case when there is no downlinked data.  These files are internal placeholders,
never visible to the public.; "Passed": the granule contains a non-degraded calibrated
brightness temperature or radiance for at least one channel in a geolocated FOV;
"Suspect": the granule does not qualify as "Passed" but contains a (possibly degraded)
calibrated brightness temperature or radiance for at least one channel (possibly
without associated geolocation);  "Failed": the granule contains no calibrated
brightness temperatures/radiances.
